Full-stack engineer who takes products from first commit to paying customers, including an AI plan-review service now sold nationwide, and builds the evaluation systems that make AI results trustworthy. Previously co-founded a legal-tech startup.

EXPERIENCE

OpenGov, Inc. Sep 2024 – Present
Software Engineer II Boston, MA

AI Plan Review — founding engineer Feb 2026 – Present

- **Shipped the company's first production AI plan review**, checking permit drawings for code compliance; its launch city praised it for catching errors human review missed. Now a paid add-on to OpenGov's permitting platform, with cities coast to coast already live or signed; it has helped win competitive deals.
- **Designed the review orchestrator** so nothing reaches a reviewer unvetted: the model must justify stopping instead of silently truncating, invented citations are dropped, and unsupported conclusions are routed to human review.
- **Built the LLM evaluation framework and results UI** to show what a prompt or model change does before customers do: one command runs production code on expert-labeled cases with repeated trials and confidence intervals.
- **Cut AI summarization cost 95% and ended upload timeouts:** rebuilt summarization as a worker fan-out after big submissions overflowed the model's context; moved PDF rendering off the request path, taking uploads from 68s to 5s.
- **Established the team's production discipline:** releases under formal change control, postmortems after incidents, and standards enforced as lint and CI mechanisms so the bar holds without anyone policing it; still owned the hard bugs, tracing a cross-tenant data leak to row-level security not applying to the table owner.
- **Shaped direction beyond the team:** wrote the Phase-2 roadmap that teammates' feature plans anchored on; built platform pieces other teams now depend on, from an advisory-lock API and org-wide CI gate to a fix merged upstream in Effect-TS; served as a go-to reviewer for teams across the organization and onboarded two engineers.

Utility Billing — founding engineer Sep 2024 – Feb 2026

- **Built the event-driven bill-run workflow that turns meter reads into bills,** then scaled it for the first production customer: a ~14,000-invoice run that had never completed now finishes in under an hour.
- **Created the late-fee and one-time-charge subsystems on top of it, database to UI;** four engineers extended them for a year without a rewrite.
- **Unified journal-entry posting** from four billing workflows behind one schema-typed client and a transactional outbox, giving the city's ERP a single auditable path.

Zhaohua Xiance (sxfy-info.com) 2022 – 2024
Co-Founder & Technical Lead (concurrent with M.S.) Remote

- **Co-founded a law-firm operations platform** spanning case management, financials, conflict-of-interest search, and AI case analysis; led a team of five to commercial launch, 10+ paying law firms, and two funding rounds.
- **Developed the product end to end** — a bilingual React/Tailwind application with real-time collaboration over WebSockets — and integrated the agentic LLM assistant the firms used for case analysis and document drafting.

My Car Auction, Inc. Mar 2021 – Jul 2022
Software Developer Irvine, CA

- **Trained a custom NER model** (spaCy) that normalizes free-text vehicle listings to a canonical catalog, and built the Python/Selenium market-pricing pipeline that fed it from Carvana, CarMax, and Manheim.
- **Architected a serverless inspection-report service**: an SQS-driven Lambda pipeline rendering vehicle reports to S3, provisioned with CloudFormation; also delivered Spring Boot services and a Flutter mobile CRM.

TECHNICAL SKILLS

AI & Systems: LLM evaluation, agent orchestration, RAG / hybrid retrieval, Amazon Bedrock, PostgreSQL, Kafka, BullMQ, AWS, Kubernetes, Docker, distributed systems, PyTorch
Languages & Frameworks: TypeScript, Python, SQL, Node.js, Effect-TS, React, GraphQL, Java

EDUCATION

Brown University — M.S. Computer Science 2024

University of California, Irvine — B.S. Computer Science 2021
