Software engineer who has taken two products from first commit to their first production customers — an AI plan-review service and a utility-billing platform — and builds the evaluation and audit infrastructure that makes their results trustworthy. Previously co-founded and launched a legal-operations platform as technical lead.

EXPERIENCE

OpenGov, Inc.

Software Engineer II

Sep 2024 – Present

Boston, MA

AI Plan Review — founding engineer

Feb 2026 – Present

- **Shipped an AI service** reviewing building-permit drawings for code compliance, from first commit to a production city in 11 weeks; an early customer praised it for catching errors human review missed. Now approaching GA.
- **Designed the review orchestrator** so the model must justify stopping instead of silently truncating, with an evidence gate that sends unsupported conclusions to human review and drops invented citations.
- **Built the LLM evaluation framework** the team now measures the product against: expert-labeled golden tasks, 25 typed checks, and repeated trials with confidence intervals, replacing a suite whose numbers nobody could trace.
- **Owned agent cost and latency:** after a production context overflow, rebuilt the summarization agent as a worker fan-out and cut its cost 95%; moved PDF rendering off the request path, taking API latency from 68s to 5s.
- **Set the team's production discipline:** releases under formal change control, postmortems after incidents, and standards enforced as lint and CI mechanisms so the bar holds without anyone policing it; still owned the hard bugs, tracing a cross-tenant data leak to row-level security not applying to the table owner.
- **Set direction beyond the team:** wrote the Phase-2 roadmap that teammates' feature plans anchored on; landed an advisory-lock API and org-wide CI gate in the company platform and a fix upstream in Effect-TS; reviewed 136 PRs across 10 repositories and onboarded two engineers.

Utility Billing (billing platform & integrations)

Sep 2024 – Feb 2026

- **Took the billing platform to its first production customer:** rebuilt invoice generation as the event-driven pipeline every later go-live launched on; a ~14,000-invoice run that had never completed now finishes in under an hour.
- **Built the late-fee and one-time-charge subsystems from scratch** through calculation, review, notices, and ledger posting; four engineers extended them for a year without a rewrite.
- **Unified journal-entry posting** from four billing workflows behind one schema-typed client and a transactional outbox, giving the city's ERP a single auditable path.

Zhaohua Xiance (sxfy-info.com)

Co-Founder & Technical Lead (concurrent with M.S.)

2022 – 2024

Remote

- **Co-founded a law-firm operations platform** spanning case management, financials, conflict-of-interest search, and AI case analysis; led a team of five to commercial launch, 10+ paying law firms, and two funding rounds totaling \$6M.
- **Developed the bilingual React/Tailwind application** and WebSocket notification layer, and led integration of an agentic LLM question-answering system for case analysis and document drafting.

My Car Auction, Inc.

Software Developer

Mar 2021 – Jul 2022

Irvine, CA

- **Trained a custom NER model** (spaCy) that normalizes free-text vehicle listings to a canonical catalog, and built the Python/Selenium market-pricing pipeline that fed it from Carvana, CarMax, and Manheim.
- **Architected a serverless inspection-report service:** an SQS-driven Lambda pipeline rendering vehicle reports to S3, provisioned with CloudFormation; also delivered Spring Boot services and a Flutter mobile CRM.

TECHNICAL SKILLS

AI & Systems: LLM evaluation, agent orchestration, RAG / hybrid retrieval, Amazon Bedrock, PostgreSQL, Kafka, BullMQ, AWS, Kubernetes, Docker, distributed systems, PyTorch

Languages & Frameworks: TypeScript, Python, SQL, Node.js, Effect-TS, React, Java

EDUCATION

Brown University — M.S. Computer Science

2024

University of California, Irvine — B.S. Computer Science

2021
